

file (it may download a zip file). If you click on More UI Kits, you will be taken to the Adobe blog where you can explore the other options available. These UI Kits are a quick cheat to incorporate several design elements that would take a long time to create otherwise.

To use the objects from these kits or templates, export the object as an image file and then drag it on to your file or import it. You can then use it once or add it to your Assets to be made available for easy reuse.

The current kits available are

- Smartwatches - If you want to create an Apple based smartwatch app, use this kit which conforms to the Apple design standards
- Dashboard - Contains several customizable components that can be used to create various types of screens and dashboards
- Transportation and ridesharing - As the name suggests, there are several artboards available here apt for a transportation app. Anyone looking to end the ride aggregator duopoly (could also soon be a monopoly)?
- Travel - Building the next MakeMyTrip or Cleartrip? This is the kit you want and need.
- E-commerce- Need we say anything?

If you are a beginner, just learning the ropes without a specific design requirement from a client, these kits are a good place to start. Understand the basics and then move on to the difficult stuff like creating your own icons. **d**
