To share, select the homescreen and on the top right corner, select the icon and then select Publish Prototype from the drop down menu. Next, select from the options given. You can allow viewers to comment and provide feedback, open in fullscreen, allow hotspot hints and require a password. If you do not have a home screen set or any wire interactions set, all the artboards will be shared.

The allow comment option is selected by default and is very useful to understand the required changes to the design. The viewer will need to sign in to comment on a prototype either by using an Adobe ID or as a guest. They can click on Show Comments to open the comment panel and leave a comment. Whenever any viewer leaves a comment, you will be notified. Open the link you shared with them and you can reply to the comments. If there any changes or updates to be made, make the changes in the design file and update the prototype. Then resolve the comments by clicking on the Resolve Comment button. Resolved comments disappear from your comments list, but you can view them by clicking View Resolved Comments. You can also move a resolved comment back into the Unresolved section in the Comments panel. Viewers also can pin a comment to a location on the artboard. To pin a comment, type in your comment, click Pin to Artboard, and then drag the pin to the specific location on the artboard.

If you select the 'Open in fullscreen' option, the prototypes open in full screen at 100% of the actual size, allowing viewers to get a realistic view of the design experience. Hotspot hints mean that if the user/ viewer clicks on

Publish Prototype
