

The Property Inspector allows you to change properties of an artboard

edit. You can rename the artboard by double clicking on the title in the top left corner above the white space or double clicking on the layers panel.

From the Property Inspector, you can change the width and height of the artboard, location via X and Y coordinates, enable scrolling, change the background colour and add in a column or square grid. Any action can be easily undone by a simple Ctrl + Z.

As you copy or drag the artboards, you will see a purple line at the top or bottom if the edges are close in alignment. If they are not in alignment, you can align them by multiple selecting the artboards and then selecting one of the align options at the top of the panel.

If your design extends beyond the preset size, you can add in a vertical scroll bar. This can be done by dragging the bottom of the artboard to the desired length. A dotted line appears on the artboard which indicates the start of the scrollable content. For a custom artboard, open the Scrolling section of the Property Inspector and select Vertical and enter in the Viewport height. This has to be less than the height of the artboard. Then you can simply drag the dotted line to the position you want the scrolling to begin. Disable scrolling by selecting None in the Scrolling section.

You can also easily align objects inside an artboard by using the grid options. Select the artboard, click the button in the Grid section on the panel. You have 2 options here - square and layout. Square grid provides guides to which you can align objects and text. If the object is close to the grid line i.e. in the snap to zone, it will snap to the grid automatically. You
