

Layout margin buttons. The one on the left selects uniformly and the right allows you to change the margins of every column individually

can determine the size and colour of the squares. The other option is the Layout grid which gives you columns. XD automatically calculates the optimum number of columns needed for an artboard according to the size. Remember, if you resize the artboard, the objects do not follow the resizing i.e. they will not move with the columns. You can change the space between columns known as gutter width or the column width. You can also change the size of the margins either uniformly or by selecting individual margins.

To hide the grid, deselect the Grid button.

Let There Be Design

Always, always press the Esc key twice after doing an action with one of the object tools otherwise you will just keep creating objects.

Clicking on the icon on the left of the artboard title on the Layers panel will open up the asset layers for that artboard. At this point, we don't have any assets so it's empty. Download the Wireframes UI kit from the main menu and you have all the assets you will require at your disposal. Now let's create an UI using this file.

The first step is to add in an artboard to this file, give it a name and drag it to an appropriate location. We will select the Android Mobile 1 as an example. Let us try and understand a design process. First think of the main elements you want to incorporate in it. Then think of the flow and structure.

At this point you should also download the practice files from Adobe
