

the concepts learned here to create the rest of the screens. This will be the first page displayed when a user opens the app for the first time. It will ask the user to either sign up or to login. This will also need a Welcome sign with some details about Digit. Create an artboard and name it Digit - Login Screen.

Let's add in the name Digit at the top of the artboard. Click on the text tool T on the left hand side menu bar. Click on the artboard- you will get a text cursor. Type in Digit. Select the text using the Select tool and drag it till a purple line comes in the centre. This means that the text has been aligned right in the center of the artboard. Resize the text object by dragging along the point given on the bottom edge. You can edit the text properties from the Property Inspector panel. Change the font to your liking, alignment with respect to the text box, line spacing, character spacing, font colour, background colour, text border colour etc. We have selected the font Lucida Console with -100 character spacing and white font colour.

Include- <https://belpx.adobe.com/xd/belp/drawing-text-tools.html>

We also want to add in a black background for the text as it appears on the website. Select the rectangle tool and draw a rectangle from the top left corner. It's a good idea to turn on the square grid for the artboard. Once you have drawn this, you can select the rounded handles and drag them inwards for a round shape or type in the corner radius in the property panel.

Below this, we will have the Welcome text. Again use the text tool and write Welcome. From the Asset panel, use one of the ready character styles or create one from the Property panel. Again, center it. Below it, add in a text giving a brief about Digit. Select all 3 objects/ text boxes and align them horizontally in the center.

Now you need to add in the relevant fields. Select the rectangle tool and draw an appropriate sized rectangle with blue borders. Write in the text Email Id inside the box and colour it gray. Now you need the same box below it for password. Select the box and the text box and copy

NOTE:

If you change the font size from the Property Inspector, it will not increase relative to the center of the page. So it's a good idea to resize by dragging it.

NOTE:

You can add in the character style, colour and symbol to the asset list for easy use for future screens. It would be a good idea to add in the header as a symbol since you might be using it for future screens.
