

paste them. Drag them down below the Email Id box and change the text to Password. Paste the box again and fill it with blue colour and change the text to Login with white font. You should also add in a functionality to login using Twitter or Facebook. Create a text box 'Login With'. The Twitter and Facebook symbols are already present in the wireframe. Search for them in the Assets panel and drag them on the artboard. Resize and change the fill colour. Your login screen is ready.

Icons

In the earlier example, we simply used a ready icon  from the existing wireframe for Facebook. Let's see how can we create the icons on our own. Go to the Ginchy practice file and look at the First Kiosk artboard. See the envelope icon  for newsletter? Let's create this icon.

Breaking this down, this icon contains two elements- a rectangle with round corners and 2 lines intersecting below the center of the square. So select the square tool and draw a rectangle. You can draw a square by holding down the shift key while drawing. Give a small radius for the round corners- say 5. For such small radius values, it's better to type in the numbers rather than using the mouse.

Select the line tool and position the cursor on the top left corner of the box so that the two intersecting edges are highlighted. Draw a line from there to the center of the box. As you go to the center, you will blue lines appear denoting the vertical, horizontal half of the box. You might even see the center- the point where both these lines intersect. You want to travel along the vertical blue line to the lower half of the box. Once this line is done, copy paste it at the same spot. Select the upper marker of the line and drag it to the top right corner of the box till the two edges are highlighted. Release the mouse button. If you zoom in, you will see that the top points of the line are outside the box as we see it. This is because the box we see has rounded corners but the intersecting lines are of the original box. Press the Shift key and select both the lines. Right click and group them. Resize them

Congratulations! Your first artboard is ready
