

**Exclude Overlapping Shape Areas-** Inverses the shape- blanks out the intersecting part, turns filled regions into holes and vice versa.

An intersect turns this

Into a boomerang version of David vs Goliath

As you have undoubtedly noticed, performing a operation, groups the objects. Have you tried ungrouping them by using right click? If you do that, you get the original shapes back. Boolean is what is known as a non-destructive tool- it retains the original shape while showing you a different picture. This grouped object can now be edited separately from the property panel.

Also remember, the order of the object is critical as the operations are performed using the topmost object.

## Masks

No, not the green mask or an spidey or iron man mask. An effective tool to inversely crop out the un-selected portion. This is very useful in making profile picture icons. Let's see this with an example. Let's extract the face of this comically villainous character

Draw a shape that you want to use to mask the object. It can be an ellipse, circle, square, rectangle or even a free drawing. It can have a colour or no fill, border width etc. None of that matters. Place the shape on the object. Select the mask and the

This is what we begin with
