

write the headline and subtitle with the test tool and add in a bookmark start from Symbols in the Assets panel (this symbol is already present in the wireframe file). Now you need to create multiple such sections.

Instead of creating another one, you can use a little functionality called Repeat Grid. Select all the elements like the image space, headline text, subtitle text and star and click on Repeat Grid on the Property Inspector panel. A green dotted line appears around the box with a handle on the bottom and on the right. Select the handle and drag it downwards. It creates a duplicate of the box along the same axis and groups them together. Drag it down to create as many repeated groups as you want.

You can edit the individual aspects of the grid like changing text, adding in an image etc.

One cool feature here is that you can directly drag a .txt file on the repeat grid and it will automatically update the contents from the file. Let's use the Homepage artboard as example to test this feature. Create a .txt file using Mac's TextEdit or Windows' Notepad with the return/enter separator between each text data. From the source folder, directly drag it onto any one of the grid's text box. It will automatically fill out the text boxes in sequence from the .txt file. Also, it will fill up only for the same property text box. So if you drag it to the headlines, it will up all the headlines, if you drag it to the subtitle, all subtitle text boxes will be filled.

Similarly, you can also directly drag images from your folder onto the image placeholders. The image placeholders are outlined below

You can drag multiple images and they will fall in the box in order or you can give a
