

order to them from 1, 2, 3 etc. In that case, they will fall in the sequenced order. You also don't have to worry about size, they will be resized to the frame.

To increase the space between the elements of the grid, select the grid and hover over the gap between the elements. When the cursor changes to double arrows, the padding area is highlighted in pink and drag to increase or decrease the padding.

You can increase the gap between grids and it will auto adjust all elements

Now you want to include a search functionality into this design. So you need the globally understood symbol for search (think Sherlock Holmes-yes, a magnifying glass). You can draw it with two concentric circles, use the subtract operator on them and a rectangle tilted to make the handle. Let's give it an inviting blue colour.

Select the circle and in the Property Inspector panel, click on the rectangle next to Fill. The Color Picker appears. You have 3 options on top- Solid Colour, Linear Gradient and Radial Radial Gradient. Solid colour will give an uniform colour to the selected object, linear gradient will give a shading and radial gradient will give a shading emanating from the center. You can create a multiple colour effect using gradient.

Let's use solid colour here. Below the dropdown item is colour field, where you can select the colour. Alternatively, you can also select Hex or RGB or HSB values (below the colour field) if you know them. To the right of the field is the shade card where you can select the base colour. To the far right is the opacity slider which adjusts the hue. All these options are common for solid and gradient colouring. Select the colour of your choice for the search icon, play around with the colour field and opacity slider and when satisfied and click outside the color picker. You can add this colour to your swatch (at the bottom) to add it to your list of favourites.
