

Bring your ideas to life

There really isn't a reason to not use a prototyping tool as part of your application development process. Gone are the days when UI and UX designers were essentially developers with a creative streak since knowing the IDE was practically necessary for UI and UX developers. Nowadays, anyone can make an app prototype within a matter of hours. A prototyping tool is basically a great way to convey your thoughts accurately instead of leaving it open to interpretation. Moreover, it's not just about communicating the right idea but there's also the fact that fast prototyping tools can result in a reduced lead time for feedback from all the stakeholders. So if at all there's an issue with a particular design, it'll be clear right at the beginning rather than mid-way into the development cycle.

Right now, there are plenty of UI and UX prototyping tools in the space. Some of them have become so popular and feature-rich that some of the biggest Silicon Valley companies rely on them. Companies such as Twitter, Netflix and Uber, among countless others use tools such as InVision, Flinto, Origami Studio, Sketch and Justinmind. So where does Adobe XD fit into all of these? And why even bother with creating a new prototyping tool while so many already exist? The simple answer would be that each prototyping tool lacks some feature or the other and there's always scope for a jack of all trades to come into the picture. Or perhaps Adobe has identified a need and wish to fulfil the same. In case of Adobe XD, it has come down to speed, simplicity and sharing.

Adobe XD's biggest selling point is that it's built from scratch to be fast and vector focused. Moreover, since it is an Adobe software, it can rely on all of the Adobe services to add value. Plus importing and exporting
