

and go through all that process again. You can directly open up a Photoshop (.psd) file in XD. Also, this file is completely editable and you can use it as part of your wireframes and share it. To use only selected objects from Photoshop, just copy and paste on XD. When you copy it from Photoshop, any layer you paste in XD, including text, will come in as a bitmap image. Another method is to export it as SVG and import the SVG file in XD. Similar process with Sketch and Illustrator (the exception is directly opening a Illustrator file in XD - that doesn't work).

Now would be a good time to take a step back and look at the design till now.

Not bad, but can be better. How about giving the name Digit a bit of a blur effect? OK let's go for it. Draw over the title square

We think it looks cool, what's your opinion?

(the entire black square) with another square. You can use any other shape, draw over only the name part etc also if you choose to. In the property panel of the new shape, go to Blur

and select Background Blur. This blurs the image underneath the new shape. Adjust the blur properties like blur amount, brightness and opacity.

Marquee select (mouse drag over the object) and group the images together. Add this image to your symbols list. Replace the header on the Login screen with the new image. The new screens look like

You can also blur an entire object like the images next to the headlines or the text itself. Select the object and under blur, select Object Blur and adjust the setting to achieve the desired effect. To turn off blur, simply dese-
