

These are the four views that make up our mockup

Design tab - this is where you create the magic. Click on the Prototype tab to enter the prototype mode. You can also hit till Prototype is selected and press enter. In this mode, a few of the options available are no longer seen like the Property Inspector panel, drawing and text tools etc.

Creating Interactive Prototype

An interactive prototype allows you to visualize the navigation between screens or wireframes. You can set the home screen or landing page then specify which button or icon or text will take you to the next page. So you can decide the flow of the app or website here which can be shared with the developers or clients. After creating the prototype, you can also preview it to understand if it meets your criteria and benchmark and make changes if any.

The first step to creating a prototype is to specify the home page. This will be the first page shown when you start the app or website. To specify the homepage, select the artboard. On the left top corner, you will see a gray box. Click on this box to set this as the homepage. Now add a wire from this screen to the next. Either select the entire artboard or a specific button like the Login button. A blue button will appear on the right. Drag this button to the next screen you wish to display. So select the Login button, click on the blue box that appears on the right of the Login box and drag it to the Homepage screen. A connector will appear from the Login button to the next window. Release this connector at the Homepage artboard. This means that the Login button has become interactive and clicking on it in preview will take you to the Homepage screen.

If you have not set the home screen, the first wire you draw from will be the home screen.
