

The final sequence of trigger events across the project

Result Screen and from Search Result to Search Target page. Drop in a connection from the header to the Homepage artboard. So clicking on the header on any screen will take you to the Homepage.

In the second screen i.e. Homepage artboard, there is a repeat grid object. From this grid you can select one object and connect it to another artboard by drawing the wire. You can also choose to select the entire grid and draw a wire from that point. This will make all the objects in the grid interactive.

Once the wire connections are in place, let's see the actual gameplay. Hit the preview (play) button located at the top corner of the screen. A new window will pop up showing the home screen or the the artboard that is selected, if any. Hover over the button from where the wire begins and the cursor changes to a hand. Click on it and it will take you to the next screen. If you want to add another wire or change the transition settings, close this window and go to Prototype mode and make the changes. You can see all the connections between your artboards (except those that are triggered directly from artboards) by pressing **Cmd + A** (on Mac) or **Ctrl + A** (on Windows) in the Prototype mode.

You can also record this preview as an .mp4 file. On Mac, you have the Record button right on the preview screen. Although this is not directly supported on Windows, the workaround is to use the native recorder. This can be accessed by pressing **Windows + G**.

But wait, these artboards are created for a mobile app. Shouldn't we be testing it on a phone? Absolutely right. And this is also easily doable.
