

One of the advantages of developing a custom ROM is that it improves performance but it can come at the cost of reducing stability. So be careful.

Why you might want to stay off custom ROMs

- **Things could go south**

It's important you choose the right kind of ROM for your phone. The flashing process is when you actually install your custom ROM. If something goes unexpectedly during the flashing process, it could end up leaving your phone in a 'bricked' state. With newer phones, it is least likely to happen. But it is something you need to be aware of before you start your tinkering journey in the world of custom ROMs.

- **Bugs, bugs and more bugs**

A custom ROM, unlike its stock cousin, has not been tested for bugs and other malfunctions by your manufacturer or even your carrier. This would translate to system instability. The symptoms - your apps could start and restart suddenly and the same could happen with your phone. But the good thing is that there are a number of forums available where you could drop queries about your custom ROM misbehaving and chances are you might get a helpful response much earlier than you would have from your manufacturer or carrier had you seen the same problems with stock firmware. That is the beauty of the open source community.
