

Make sure you have the right tools for the job before starting

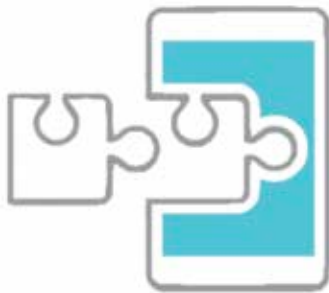

smoother. Magisk, as an app, is based on modules which means that means that Magisk can be used radically differently by various users. A number of modules exist for Magisk, but for that you need to get your hands on Magisk first. To download Magisk, follow the link - <https://digit.in/Magisk>

Once you have Magisk on your device, you can decide which one of the modules you want on board. Here's a low down on some that we recommend. You can do your research on XDA forums and find more.

Xposed Framework

If you are someone with remote interest in the world of Android development, the Xposed Framework is definitely something you have heard about. Until Magisk came into play, Xposed Framework was the go-to for modification and tweaking. But thanks to the inclusion of Xposed on Magisk, now their mods are available to Magisk users.

Installation Link - <https://digit.in/Xposed>

The inclusion of Xposed on Magisk makes a lot of mods available to Magisk users
