

Combining these and other modules using Magisk brings you closer to the custom smartphone experience that you want

on devices. If your carrier has disabled it too, this module might not help much. But regardless, this mod is worth a try.

The Tether Enabler will allow tethering via USB or over WiFi - which can end up being pretty useful in certain situations and is certainly a feature that you want if you call yourself a power user.

ART Optimization

The release of Android Lollipop brought with it good news. There was a virtual machine released along with it called ART (short for Android Runtime). This module came with AOT compilation into native Android code. For the uninformed, AOT stands for ahead-of-time.

The previously introduced Dalvik implementation was good. But ART outdoes it in terms of performance. With this module, ART optimisations can be configured on your device and can be customized or changed as and when deemed necessary depending on the user of the device.
