

- Flashtool allows you to flash the stock ROM to your device and remove the custom kernel. This is the most important tool available here since you can use this tool to restore the stock ROM in case anything goes wrong. Click on the setup file and run the installer package.
- Ftf_extractor allows you to extract the various system and kernel packages.
- Notepad++ for editing source codes
- 7zip for extracting files

Using Kitchen

The very first step is to run Java JDK. This is absolutely the first step. Do not skip this step or change the order. Post this, extract the Cygwin files. Run the setup file. Select 'Install from Local Directory' option and click next.

The root directory can be any of your choice like C:\Cygwin but the local package directory has to be the Cygwin packages folder that you extracted. In the 'Select Packages' screen, click on the Default so that all packages change to Install and click next.

The Cygwin installation

There is a Home folder inside the cygwin folder which, at this point, is empty. Start the Cygwin software and let it work its magic. It will create some files in the Home folder. Now that Cygwin is installed, let's install Kitchen. Extract the Kitchen files to the Home folder within the cygwin
