

- **framework** folder is a very essential part of the ROM. It includes various jars and a few APKs which are very essential for a ROM to function well.
- **lib** folder contains various lib files for the ROM. And one thing to keep in mind would be to NEVER tamper with “lib64” folder, because, if you do so, your ROM might never boot, however “lib” folder can be modified to some extent like deknocking (which I will tell you about in future posts)
- **media** folder contains audio files including ringtones, notification tones, alarm tones and other System sounds
- **priv-app** folder contains another set of “privileged apps”. Privileged, because, they require some special permissions to work
- **build.prop** is the most important file in your ROM. Without this file, your ROM will NEVER-EVER boot.
And the working folder is ready.

Learning About Apps

Next you need to learn about odexed and deodexed apps. Odexed apps are pre-optimised apps which are more stable so there are no errors on booting. The optimization details of odexed apps are stored in a separate folder named odex. So these apps also boot faster because the system knows how that app works. On the other hand, deodexed apps are not optimised and hence boot slower. But you need a deodexed app to be able to make changes to it. And since you want to make your ROM awesome and have amazing

Before you begin editing, understand a few concepts about apps
