

The MOD

You can make some easy MODs by tweaking the **build.prop** file. Open up the Assayed kitchen and select the 'ADDING BUILD.PROP TWEAKS' option. Once it runs, go to the **build.prop** file. You can play around with the values of the mods you see here and make some simple changes to the ROM.

Here's a sample code

- #Disables Error Checking
- ro.kernel.android.checkjni=0
- ro.kernel.checkjni=0
- #Screen Mirroring
- wlan.wfd.hdcv=disable
- #Signal Performance
- ro.telephony.call_ring.delay=0
- ring.delay=0
- #Fingerprint On Reboot
- fingerprint.unlock=1
- #Save Battery Without Performance Drop
- pm.sleep_mode=1
- ro.ril.disable.power.collapse=0
- wifi.suppliment_scan_interval=180
- #Launcher Is Kept in Memory
- ro.HOME_APP_ADJ=1
- #Allow Purge of Assets To Free Ram
- persist.sys.purgeable_assets=1
- #Smooth Video Stream
- media.stagefright.enable-player=true

XDA developer forums is one of the most helpful places on the internet when you're looking to geek out with Custom ROMs and need resources
