

from the build.prop. Look for the codes `'ro.config.<ringtone/notification_sound/alarm_alert>=<filename.ogg>'` and change the value to a file of your choice. These files can be found in the system/media/audio folder.

Below, you will find a section titled 'Additional Build Properties'. Here you can edit the values for your connection settings. Find the appropriate values for your carrier online and enter in those values at the relevant codes. Make sure that enable.a53 and enable.dtm are set to 0 to fix any connection issues.

Next, you can also change the photo and video quality. To maximise the photo quality, look for the code

- `ro.media.enc.jpeg.quality=`

This value is the percentage of value you want so to get maximum output, set it to 100 i.e. 100 percent (don't type percent). You can also change the panorama frame resolution to the max level supported by your device. Similarly, understand the best values for jpeg memcap, video bps and video and fps for your device and set those values. Set all values under Media Management to True and you will see an improvement in the streaming quality of any video you play.

The next section of Memory Management and Memory Adjustment allows you to free up space to a great extent and is a boon for all the app hoarders

Custom ROMs are your way to stand out from the rest of the Android crowd
