

The easiest method is using an online module called UOT.

Create a new folder and copy these files from the system/framework folder (the names might be slightly different depending on your device)

- com.resources.apk
- Framework-res.apk

From the app folder, copy the SystemUI.apk file also. Open your browser and search for UOT Kitchen in Google and go to the Kitchen link. Here you have a plethora of options to customise the theme like changing the battery icon, status bar etc. Wherever you want to make any changes, check the 'Use this mod' box and you will see the options available. As you can see, UOT Kitchen is a graphic interface tool for changing your theme available with preset options. Makes your life much easier doesn't it? Play around with the values and settings and once you are satisfied with the preview, move on to the next tab. Finally, head to File Upload. Select System Files as the source (right hand side of the screen) and select the files from the folder created earlier. Open the Summary tab and make sure that everything is green (orange means it's incomplete). If they are all green, click

A custom theme can take a minimalist approach

on Submit Work to Kitchen. Open the Pickup Page and when your mod is ready, it will show under the recently cooked files section. Download the file once it's ready. Copy the downloaded zip file to your device and flash it using TWRP. To flash it, start the device in recovery mode (volume down + power off) and select Install. Navigate to the zip file and let the process
