

run. Once it's done, reboot the device in normal mode. Your theme will be up and running. Woohoo!

If you think this is too simple for you and you want to know how to make additional, specific changes to certain files, read on.

Copy the custom theme apk file (let's call it new_theme) that you want to load in your custom ROM to the ApkTool folder. Go to the system/app folder inside the working folder and copy the DefaultThemes.apk file also to the ApkTool folder.

To extract and decompile the file, open command prompt inside the ApkTool folder and type

- `apktool d <filename>`

Or you can be conservative and just do away with minor cosmetic changes

Separately extract both the custom theme and default theme apk files. From the extracted new_theme folder copy the new theme images to the DefaultThemes folder.

After decompiling a file, the xml file inside the folder will be readable.

Search for the correct file to edit (search on XDA forums and Google to find the correct file to edit).

Now to build the apk file again, go to the command prompt and type

```
apktool b DefaultTheme
```

It will check if there are any changes and report errors, if any. If there are none, you will see a new folder named 'build' inside the folder. Open
