

Assayed

Head straight down to the ASSAYED kitchen. From the list of options given there, look for one that reads 'BUILD ROM FOR FLASHING'. But that's like looking for the tiny bottle of oregano stashed at the end of the kitchen closet. Or not! We have just the instruction for you. The 'Build ROM' option is number 7. What that means for you the user, is to type the number '7' and then immediately press ENTER.

This will give you some more options. We need a zip file which is transferred to the device. So choose option 3 and hit enter. It will ask you to review the updater-script file (Yes, no matter which kitchen you are using, this will always be the mandatory and common step). Don't mess around with this file, so choose the default option- NO.

If it then asks you to zipalign the apks, you can choose Yes. this is optional but recommended.

In the compression options, keep the compress level to 5, again go with the default. The process of converting your ROM files into one zip file will begin. Give a cool name to your ROM and it's ready.

Ready to take your ROM on a test drive? Head to the "READY" directory where your creation will be lying in wait for you. Transfer it to your device and install it via TWRP or another recovery software. **d**
