

- `PATH="$HOME/bin:$PATH"`
- `fi`

Then, run `source ~/.profile` to update your environment.

## Initialize the LineageOS source repository

The following branches are officially supported for the OnePlus 5:

- `cm-14.1`
- `lineage-15.1`

Enter the following to initialize the repository:

- `cd ~/android/lineage`
- `repo init -u https://github.com/LineageOS/android.git -b lineage-15.1`

## Download the source code

To start the download of the source code to your computer, type the following:

- `repo sync`

LineageOS manifests include a default configuration for `repo`, which we suggest you use (i.e. don't add any options to `sync`). Our default values are `-j 4` and `-c`. The `-j 4` part means that there will be four simultaneous threads/connections. If you experience problems syncing, you can lower this to `-j 3` or `-j 2`. On the other hand, `-c` will ask `repo` to pull in only the current branch instead of all branches that are available on GitHub.

## Prepare device-specific code

After the source downloads, ensure you're in the root of the source code (`cd ~/android/lineage`), then type the following code into command prompt:

### NOTE

Make sure the branch you enter here is the one you wish to build!

### NOTE

This may take a while, depending on your internet speed. Go and have a beer/coffee/tea/nap in the meantime!

### TIP

The `repo sync` command is used to update the latest source code from LineageOS and Google. Remember it, as you may want to do it every few days to keep your code base fresh and up-to-date.
