

for LineageOS, based on Android OS, we'll take you through all of it. Using these, you can build both LineageOS and LineageOS Recovery image from source code, and then install them both to your device.

It is not a particularly easy task to ascertain the exact level of expertise needed to go through with the steps mentioned here. It is safe to say that this guide does require a basic understanding of software and how it works, although you don't need to be a PhD in software development for the same. The experience might vary from reader to reader – some might breeze through

the process while some might be struggling with the very basics. It could be because of a number of factors that are out of the user's control.

Disclaimer: The entire process is pretty risky but the rewards are worth it. It is one thing to feel the joy of booting up to your own Custom ROM onto your device. Additionally, now you don't need to wait for 'nightly' builds from any developer - you can make your own nightly builds. By the time you're done, you'll be having the skill to a full operating system to build and run on a device. What you do from this point is entirely upto you.

What you'll need

- A OnePlus 2
- A relatively recent 64-bit computer (Linux, OS X, or Windows) with enough RAM and about 100 GB of free storage (more if you enable ccache or build for multiple devices). The less RAM you have, the longer the build will take (aim for 8 GB or more). Using SSDs results in considerably faster build times than traditional hard drives.
- A USB cable compatible with the OnePlus 2
- A decent internet connection and reliable electricity :)
- Some familiarity with basic Android operation and terminology. It would help if you've installed custom roms on other devices and are familiar with recovery. It may also be useful to know some basic command line concepts such as `cd`, which stands for "change directory", the concept

NOTE

The steps below only need to be run once per device.

WARNING

Unlocking the bootloader will erase all data on your device! Before proceeding, ensure the data you would like to retain is backed up to your PC and/or your Google account, or equivalent.
