

For the next few mods you will need to decompile the SystemUI.apk file.

## To Remove High Volume Warning

Open com/android/systemui/volume/VolumeDialogControllerImpl.smali. Replace the method code (from .method private onShowSafetyWarningW(I)V to .end method) with this code

```

• .method private onShowSafetyWarningW(I)V
•     .locals 2

•     iget-object v0, p0, Lcom/android/systemui/volume/
VolumeDialogControllerImpl;->mAudio:Landroid/media/Audio-
Manager;

•     invoke-virtual {v0}, Landroid/media/AudioManager;-
>disableSafeMediaVolume()V

•     return-void

• .end method

```

## Hide Status Bar Icons While Lock Screen Is Engaged

Decompile your SystemUI.apk and visit the res/layout/status\_bar\_expanded.xml. Once there, add the highlighted lines of code

```

• <com.android.systemui.statusbar.phone.Notifications-
QuickSettingsContainer android:layout _ gravity="@integer/
notification _ panel _ layout _ gravity" android:id="@id/noti-
fication _ container _ parent" android:clipChildren="false"
android:clipToPadding="false" android:layout _ width="fill _
parent" android:layout _ height="fill _ parent">
•     <FrameLayout android:layout _ gravity="@
integer/notification _ panel _ layout _ gravity"
android:id="@id/qs _ frame" android:clipChildren="false"
android:clipToPadding="false" android:layout="@layout/
qs _ panel" android:layout _ width="@dimen/notifica-
tion _ panel _ width" android:layout _ height="fill _ parent"
sysui:viewType="com.android.systemui.plugins.qs.QS" />
•     <com.android.systemui.statusbar.stack.Notifi-
cationStackScrollLayout android:layout _ gravity="@integer/

```
