

Python code is readable and seems close to the English language as we know it

Another plus point of using Python is its own set of rules called PEP. PEP helps programmers understand how to format their code. There are a number of versions of PEP that keep getting added with time. You can check out sources like GitHub to see the PEP that is currently in use. This means that you as a programmer will always have the know-how at hand with regards to where you need to put in new lines, or even more importantly it gives you the awareness that regardless of whether you choose a piece of Python code written by a novice or a seasoned programmer, it will probably look very similar to your own code and be as easy for you to read and understand. Think about it. Within a few years of writing code with Python, your code will soon begin to look like the code that was written by Guido van Rossum (creator of Python). That ought to be an ego boost for any good programmer.

## Awesome libraries make life easier

There are two important aspects to remember here - Python has been around for over two decades and it is an open source programming language. This translates to the fact that a lot of code has been written in Python over the last 20 years. And given its status as an open source language, most of this code has been released for other programmers to get their hands on. When it comes to working on larger projects, libraries can really help program-
