

Google's endorsement helps Python get free advertising in the development world

(ii) On FreeBSD and OpenBSD

FreeBSD users can add the package by using the following command -

- `pkg install python3`

OpenBSD users can use the command at this link: <https://dgit.in/InstallOBSD>.

(iii) On OpenSolaris

You can get Python from OpenCSW. Various versions of Python are available and can be installed easily.

BUILDING PYTHON

If you are looking to compile CPython yourself, the first thing to do is to get your hands on the source. You can either download the source of the latest release or just grab a fresh clone. If you are looking to contribute patches, having a clone is a must. Follow this process for the build -

- `./configure`
- `Make`
- `make install`

Configuration options and caveats for specific Unix platforms are extensively documented in the README.rst file in the root of the Python source tree.

Please Note: `make install` can overwrite or masquerade the Python3 binary. `make altinstall` is therefore recommended instead of `make install` since it only installs `exec_prefix/bin/pythonversion`.
