

time you will need to be an administrator is if a system update for the C Runtime Library is required or you want to install the Python Launcher for Windows for all users.

Selecting *Customize installation* will allow you to select which of the features you wish to install, the locations of these installations as well as other options or post-install actions. To install debugging symbols or binaries, you will need to use this option.

To perform an all-users installation, you should select *Customize installation*:

- You might be required to give administrative credentials.
- Python will be directly installed into the Program Files directory.
- The Python Launcher for Windows will be installed into the Windows directory.
- Optional features can be selected during the course of installation.

If you need support for Windows XP, you will have to install Python 3.4 or lower.

With every passing year, Python is gaining increasing acceptance in the world of development. Both enterprises as well as clients are welcoming it with open arms. Most companies are realizing the power of this programming language. In addition to this, it is simple for companies to modify any of their tested platforms with the use of Python. This is what makes them even more open to the idea of shifting to Python if their systems currently exist in other programming languages. **d**
