

OPERATOR	DESCRIPTION	EXAMPLE
=	Assigns values from right side operands to left side operand	<code>c = a + b</code> assigns value of <code>a + b</code> into <code>c</code>
<code>+=</code> Add AND	It adds right operand to the left operand and assign the result to left operand	<code>c += a</code> is equivalent to <code>c = c + a</code>
<code>-=</code> Subtract AND	It subtracts right operand from the left operand and assign the result to left operand	<code>c -= a</code> is equivalent to <code>c = c - a</code>
<code>*=</code> Multiply AND	It multiplies right operand with the left operand and assign the result to left operand	<code>c *= a</code> is equivalent to <code>c = c * a</code>
<code>/=</code> Divide AND	It divides left operand with the right operand and assign the result to left operand	<code>c /= a</code> is equivalent to <code>c = c / a</code>
<code>%=</code> Modulus AND	It takes modulus using two operands and assign the result to left operand	<code>c %= a</code> is equivalent to <code>c = c % a</code>
<code>**=</code> Exponent AND	Performs exponential (power) calculation on operators and assign value to the left operand	<code>c **= a</code> is equivalent to <code>c = c ** a</code>
<code>//=</code> Floor Division	It performs floor division on operators and assign value to the left operand	<code>c //= a</code> is equivalent to <code>c = c // a</code>

Membership operators are important functions that you will probably use. They check whether a variable is a part of a sequence like list, tuple etc. Two operators are:

- `in` - checks whether variable is part of list. Returns true if part of the list and false if not
- `not in` - checks whether variable is part of list. (Difference between the above operator is given in italics) Returns true if not part of the list and false if it is.

Example code with output can be seen here: <https://dgit.in/MembPy>

Statements

You can use statements to code the program into taking decisions based on arguments and give different output. The output will be dependant on the relationship between 2 or more variables. This can be done using control statements like `if`, `for` and `while`.
