

- 7
-
- `>>> 0o10      #octal(10) = decimal(8)`
- 8
-
- `>>> 0xC        #hex(C) = decimal(12)`
- 12

Type Conversions

Although most type conversions are automatically taken care of by Python, we can explicitly convert type as and when required. It should be noted that not all conversions are possible, in such cases the conversion method will throw an error. For example a conversion of complex number to Integer.

- `>>> int(2.7) # a float to int conversion, truncates the fractional part`
- 2
-
- `>>> float(2)      # an int to float conversion`
- 2.0
-
- `>>> complex(3)    # an int to complex conversion`
- (3+0j)
-
- `>>> int(1+0j)      # a complex to int conversion will throw an error`
- Traceback (most recent call last):
- File "<stdin>", line 1, in <module>
- TypeError: can't convert complex to int

We can also convert number systems using the methods provided:

- `>>> bin(5) #decimal to binary conversion`
- '0b101'
-
- `>>> oct(9.2)`
- Traceback (most recent call last):
- File "<stdin>", line 1, in <module>
- TypeError: 'float' object cannot be interpreted as an integer
