

number. Since we have about billion records in the Aadhaar system, such an operation will likely take a lot of time if we search through all the records. Instead, if we find out the most frequent users of the the application and cache their data in a dictionary against their Aadhaar number as the key, we can provide faster and better data access by returning the cached data from the dictionary instead of querying the database. The overhead to access a dictionary object is much cheaper than a database query.
