

Functions and Methods

Functions is the foundation of learning Python and as such is one of the most popular and important tools used

The Function tool is one of the most important and widely used feature of Python. A function is just a predefined code organised into one line so it's extremely easy to use and read. The function tool bundles several lines of code into one sub-program that can be called when needed. So a code of several lines can be grouped into one function and reused. It keeps your code concise and neat and makes it highly reusable. Any command like *print* or *help* or *min* are also functions. Just like *print*, there are several in-built functions but the real beauty is that you can create your own functions. These are called user defined functions.
