

- **EOFError**- Raised when there is no input from either the `raw_input()` or `input()` function and the end of file is reached.
- **ImportError**- Raised when an import statement fails.
- **KeyboardInterrupt**- Raised when the user interrupts program execution, usually by pressing Ctrl+c.
- **NameError**- Raised when an identifier is not found in the local or global namespace.
- **UnboundLocalError**- Raised when trying to access a local variable in a function or method but no value has been assigned to it.
- **IOError**- Raised when an input/output operation fails, such as the print statement or the `open()` function when trying to open a file that does not exist.
- **SyntaxError**- Raised when there is an error in Python syntax.
- **IndentationError**- Raised when indentation is not specified properly.
- **TypeError**- Raised when an operation or function is attempted that is invalid for the specified data type.
- **ValueError**- Raised when the built-in function for a data type has the valid type of arguments, but the arguments have invalid values specified.

When a Python script raises an exception, it must either handle the exception immediately otherwise it terminates and quits. So at the line where it raises an error, the code will terminate and not move forward. So if there is an exception raised at the very first block of code, the program

A digital display with a black background, showing a grid of numbers in a light blue or cyan color. The numbers are arranged in a grid pattern, with some numbers appearing to be error codes or system identifiers. The text "System Error Codes" is prominently displayed in large, bold, red letters across the middle of the grid. The numbers are arranged in a grid pattern, with some numbers appearing to be error codes or system identifiers. The text "System Error Codes" is prominently displayed in large, bold, red letters across the middle of the grid.
