

- `print()`
- `print("Congratulations! You guessed it correctly.")`

If you run this program with the user input values as 1, 20 and 10 respectively, the output will be

- Enter a number: 1
- This value is too small, try again!
- 
- Enter a number: 20
- This value is too large, try again!
- 
- Enter a number: 10
- Congratulations! You guessed it correctly.

Now that you have learned more about errors and how to handle exceptions, this will hopefully reduce your heartburn next time you encounter an error or suspect that a piece of code is likely to throw up an error.
