

all the different objects such as numbers, strings and lists that one can use for variables in Python. We then move on to some complex objects before starting off with our first methods and functions. Once, that's taken care of, we dive into the whole concept of modules and Python packages. With this new information, we then set out to checking out some of the most popular Python Modules that you can use to accelerate your project development. By then we believe that you will have grasped the bare essentials of Python, and you'd be ready to go out and build your first project.

In the DIY chapter, there's little hand holding, so you're expected to build the projects we've listed on your own. We do, however, help you with the approach to getting the job done. Should you be stuck at any point, then you can always write to us at editor@digit.in and we'll share the code that we've written to tackle the DIY projects. So what are you waiting for? Jump right in! By then end of it all, you'll be singing The Zen of Python along with us.
