

Python Modules

Python Modules - Part 2

Let's look at some of the more advanced Python modules such as StringIO, timeit and regex.

StringIO & BytesIO

Python provides us with an `io` module to deal with various kinds of input and output operations. These libraries majorly deal with a file or file-like object and also allow us with the functionality of seamlessly reading and writing `Unicode` data.

StringIO provides us with an in-memory stream for text-based I/O operations, which is maintained in a text buffer. The initial value of the buffer can be provided using the `initial_value` parameter in the constructor. The stream points to the start of this buffer. If not provided, it initializes an
