

remain the same. For instance, you will still see it being used for similar tasks as it was being used almost 25 years ago.

This is possibly one of the primary reasons why Python has become so popular even in recent times. It is a production-based language which is meant for first class projects and enterprise. It also boasts of a rich history. This, in turn, means that it can be used for almost anything, which makes it one of the most versatile languages out there. Whether you want to configure servers, run scripts for desktop programs or build applications, Python can be your go-to language.

This makes Python one of the most popular dynamic programming languages that is in use today. It is an open-source and object-oriented programming language which was developed by Dutchman Guido van Rossum back in the 1980s and was named after Monty Python. Given the elegance and simplicity of this language, top tech organizations like Google, Quora, Dropbox, Mozilla, Qualcomm, IBM, Hewlett-Packard, as well as Cisco swear by Python.

So, what is Python?

Python is best described as a general purpose programming language which was created in the 1980s. It has been used by thousands of people to perform a wide range of tasks from testing microchips at a company like Intel or powering up Instagram as we know it today or even building video games with the famed PyGame library. The best thing, perhaps, about Python is its resemblance language. And one of its biggest advantages are the hundreds of existent third-party libraries. Let us go over some of the top reasons why a programmer is more likely to choose Python over other available programming languages.

Reading Python is easy

At first glance, you will realise that Python reads just like the English language does. The resemblance makes it easier to work with, especially if you are a newbie. You will often see terms like 'not' or 'in'. This makes the program more readable. If you read a script or program from Python aloud, chances are your listeners will understand what you are saying. It will not sound like technical gibberish. Python comes with its own sets of strict rules as well, especially as far as the punctuation marks are concerned. This gives programmers and people involved some code that is free from innumerable curly brackets ({}).
