

matching with your component colour scheme. You will get the same cooling performance with a transparent coolant. Also, some coolants can cause more harm than good to your entire cooling loop.

RGB lighting: Lighting has never served any advantage to cooling performance. RGB lighting is being slapped on everywhere, even on CPU and GPU blocks. We aren't far away from the time when RGB LED strips are attached to the heatsinks. But keep in mind – this does not affect their performance in any way.
