

Lian Li PC-Q05

Noctua NH-D15

Your average AIO

case. There's no point getting a third-party CPU cooler since there is no way you can use it in such a restrictive environment.

If you're looking at a more beefy cooler such as the infamous Noctua NH-D15 as pictured here, then you simply can't get a SFF cabinet at all. In fact, you can't even get more than half the budget mid-tower cases in the market because the z-height of the NH-D15 is too high at 165mm. Without the fans installed the NH-D15 stands 150 mm tall and even that is a bit too much for budget cases.

A simple rule of thumb is that a stock cooler will be sufficient for majority of the use cases. Only outlandish cases such as the Lian-Li PC-Q05 will you require a custom solution.

Closed-loop AIOs

Closed loop All-in-one coolers are the second most popular cooling solutions in the market. With these you don't have to worry as much about the clearance areas since the CPU block is often small enough to not

warrant a worry. Your major concern is to ensure that all the components of the cooler can be installed on the chassis. For AIOs, this comes down to just two components, the radiator block and the accompanying fans.

AIOs come in different sizes based on their radiator size. We see 120, 240 and 360 mm radiators being the most commonly available ones with some
