

For motherboards that don't have a included water cooling block, you can buy ready-made ones. However, do note that manufacturers only make VRM water blocks for very few motherboards. VRM blocks are a niche in the water cooling industry and manufacturers pick motherboards based on user-interest or user-demand. Most often, the manufacturers will work with motherboard brands to identify which motherboards are being designed to cater to overclocking enthusiasts and then build VRM blocks for those motherboards.

Here we see a VRM block for an older ASUS motherboard which was also designed to appeal to enthusiasts. Since there is no standardisation for how motherboard brands mount heatsinks on the VRM, we see a lot of different screw arrangements across brands. As a result, the VRM block made for one particular motherboard will not necessarily fit another board. You can now see why these blocks are a niche within a niche.

Custom built VRM block

M.2 SSD

M.2 or NGFF (Next Generation Form Factor) is a versatile interface for connecting peripherals to your PC. It's widely used to connect SSDs but because the interface has provision for PCIe lanes, it can be used for practically every peripheral under the sun if they can be designed for the small M.2 form factor.

Until recently, M.2 was used for normal SSDs which did not require the PCIe lanes and could simply use the M.2 SATA interface. The bandwidth for
