

you longer and work consistently. And it's easier to choose a good pump when there are two well-known and trusted pumps out there. You will generally find the Laing D5 or Laing DDC pump being sold by liquid cooling product manufacturers. The main differences between them is the size and

noise levels. While the D5 is quieter, the DDC is has a smaller form factor. The D5 is more popular and there are several variants under it where the pump speed can be adjusted based on different types of methods. The Vario variant is commonly found and it uses a dial at the bottom with five speed settings. This is analog control while there are options for PWM and USB connections which is easier to control.

Speaking of the DDC pump, it offers better head pressure which means that it can provide better liquid flow in the loop. When your loops have too many bends and blocks in between, it becomes a little difficult for the fluid
