

to flow properly. This is where the DDC pump proves its worth. However, since it tends to be loud, enthusiasts prefer the D5 for normal builds.

Although it's nice to have modularity with the freedom to choose the pump type and reservoir, pump and reservoir combos make life easier. Essentially, they are reservoirs with pumps on the bottom. Available in both the previously mentioned variants, we would recommend you to go for a combo instead of taking the trouble of separately buying them. The combos are also available in variants of analog, PWM and USB control.

Radiators and fans

In any liquid cooling system, the radiator is an important component. This is where the heated-up fluid comes in contact with the metal fins and dissipates heat, rapidly with the help of the fans. Since there are already so many parts involved in this system, there are quite a few factors you should consider. However, picking the right radiator and fans shouldn't be much of a problem. You must be already well aware about your PC case's specifications and clearance assuming that expanding to a custom loop liquid cooling system was in consideration from the beginning. With the knowledge of the maximum clearances on various parts of the case, it will be easier to select your radiator and fans.

The first thing to consider is the surface area based on the length and thickness of the radiator. A longer and thicker radiator will offer better
