

throughout the loop. It all comes down to what you wish to achieve in your system. You will come across different brands selling soft tubing and popularly, the PrimoFlex Advanced LRT from Primochill and Tygon tubing are considered to be great options. You can either choose clear tubing or coloured tubing. By using clear tubing, you get more options of colour with the coolant rather than being stuck with the limited number of colour options in opaque soft tubes.

Alphacool PETG HardTube

Coming to the hard-tubing side of things, there are many options including Alphacool HT, Bitspower, EKHD and Primochill, that can be considered. You can choose between acrylic, glass and PETG for hard tubing where both have their advantages and disadvantages. Under hard

tubing, enthusiasts are also using opaque materials like brass, carbon, copper and aluminium, but they are usually custom built by themselves. After having chosen the kind of tubing you want to use in your system, it's time to consider the most important point and that is the measurements. It isn't too complicated. You only need to remember two things – inner diameter (ID) and outer diameter (OD). All you need to ensure is matching the sizes with appropriate fittings. For example, if you're buying a barb fitting then you should match the ID of the soft tube. When it comes to buying a compression fitting, you have to match both the ID and OD of the tube whether soft or hard. There are far more factors that need to be considered in tubing along with the fittings that we will be covering in the next chapter.

Accessories and tools

The potential of customisation in an open loop liquid cooling system is enormous. And it exists because of the massive number of accessories and secondary parts available. After you're done buying the previously mentioned parts, you can optionally opt for more tiny and useful parts that will take care of certain problems. Additionally, they include certain fittings and joints that could help you in achieving that specific loop design you were aiming for from the beginning.
