

Mandrels will make your hard tube bends more accurate

tools. The most important tool while using acrylic and PETG is a heat gun to bend the hard tubing. Bending at the desired angle can be difficult but you will find different mandrels or bending stencils that can be used to achieve accurate angles including 45, 90 and 180-degree bends. If you don't want to spend too much on mandrels then you can go for angle rulers. To ensure your curves are uniform while bending with a heat gun, you will need Silicon inserts. Since the tube is hollow, the tube might not bend in a curve properly. Hence, it's

always best to use these inserts which are heat resistant. Make sure you match the ID of the tubing with the diameter of the inserts. Hard tubes will require hacksaws to cut them down but they don't really offer a good finish. However, you can opt for Reamers that will make the ends of the freshly cut tubes uniform for better fitting. **d**
