

so it's always best to leave some extra room in the case. Cleaning the case and all the components (if used before) going inside would be better since any kind of dust would cloud the container. Now you're wondering how the mineral oil is cooled. Well, the mineral oil is pumped through a radiator outside and cooled normally through heat dissipation using fans. You can either build your own mineral oil aquarium or consider commercial solutions.

Mineral oil cooled PC kit from Puget Systems

Turbocharge

Turbocharging your PC sounds amazing but it doesn't do much cooling as you'd imagine. However, it does manage to keep your PC running at favourable temperatures. A turbocharger essentially increases the airflow immensely compared to what case fans can do. Also, the idea of using a car's turbocharger to cool your PC will be a great bragging right. Based on what configuration you prefer, you can either choose to pull air inside the case using the turbocharger or use it as a powerful exhaust. Any configuration will be terribly loud and will require a lot of power all the time to function at all.

The Raktron Turbo PC shows how to literally turbocharge your build
