

Once you have a proper idea of what your game should look like, it is a good idea to start producing the assets. This means the objects, sprites, background elements and the player character. Typically, on modern 3D games, this involves using a 3D software such as Blender, 3D Studio Max or Maya. If the assets are characters, then they will have to be rigged as well. A sculpting tool such as ZBrush helps you add fine detailing and contours to the character. These 3D assets will also need textures, for which you can use image editing software such as Photoshop. If you want to learn game

Cuphead is one of the more popular 2D games created using the Unity game engine

designing professionally, this is a handy list of software that you should look for in a course offered by the institute that you are considering.

Unity has its own asset store, where quite a few assets are available for free. You can also buy assets from online marketplaces such as TurboSquid. If you are getting characters, it is a good idea to make sure that they are rigged and ready for game development. After that, you can get to building the game on Unity. Once the first prototypes are built, the process of tweaking and testing the game starts. Getting the feel of the movement and mechanics just right takes a lot of fiddling around with the settings. Fortunately, Unity lets you find out what kind of settings you want to fiddle with while building the game itself.

You might need to commission a soundtrack, or produce one yourself if you really want to make a game all on your own. After that comes the marketing, which is actually the most difficult part. It is a highly competitive environment for indie game developers, and getting visibility is the most
