

difficult part. Essentially, the more money you spend on marketing, the more people install the game, and generate more revenue for you.

For this FastTrack, we will focus on a very simple game. You can create all the assets you need within Unity itself. The main character is just a sphere. You will understand the physics of moving it, setting the play area, controlling the ball, controlling the camera, lighting the environment, collecting in game objects, spawning in game objects and showing a score. There is very minimal scripting required here, and all of it can be copy pasted. Once of the most difficult aspects is to ensure that the camera moves as expected, and taking care of bugs and glitches. Make your ball move too fast, or jump too high, then the game is likely to break. The ball can move out of the play

Aerox topped the charts in many countries, and is a ball rolling game created using Unity

area, or speed its way through the ground. An example of a good ball rolling adventure game created using Unity by a single developer is Aerox.

At the end of the FastTrack, you will have produced a game with all the simplest elements of a 3D game. However, if you do know how to handle 3D software properly, you can start with this simple game and make it much more complicated. You can add platforms or puzzles, stages, and levels. You can also make a digital playground for the ball to roam around in and explore. The possibilities are endless, and this is a solid ground to start on. Unity allows you to build for many target platforms, including desktop computers and mobile phones. One of the best things about the Unity game engine is the active and helpful community, which makes sure that you get through any rough patches that you may encounter over the course of developing your game. Unity also allows you to manage the game once it is released, by pushing out updates, and tracking usage across the world. So, lets get started. **d**
