

in your game. While in this view, you will need to control the cameras to ensure you can see what the player will actually see while playing your game. There is a chapter coming up later that will tell you more about camera placement. While in the Game View window, you have an option of turning Play Mode on. This lets you see how the published game will play. Any changes that you make while in Play Mode will be reset when you exit the mode.

The Inspector window

Any and all games made using the Unity Editor will consist of multiple Game Objects. These GOs are made up of meshes, sounds, and a number

The Inspector window

of other graphical elements (for example – lights). While in the Inspector Window, select the GO that you wish to interact with. Once selected, you will be able to see detailed information about the selected object as well as make modifications, if any, to said object.

Getting to know the toolbar

The Toolbar, while not part of the five main windows that make up the Unity interface, sits at the top of the interface. It is integral to the game design, in such that it relates to different parts of the Editor through the seven basic controls that are displayed. Here's a look at these controls –
