

Layout Drop-down

This allows you to switch between multiple saved layouts for the Unity interface during your development.

Searching in Unity

Most games, whether 2D or 3D will generally have large complex scenes. While working in such scenarios, it always helps to have a dedicated 'search' option that allows you to find specific objects of your choice. You can use the Search feature in Unity to filter out the object or group of objects of your choice. It also gives you the option of searching for assets by their component, labels, name or type.

The Scene as well as the Hierarchy views have search boxes that allow you to filter objects by their names. Given that both the views display the same set of Objects (in different representations nonetheless), any search query typed will be applied to both views simultaneously. The scene view will show filtered objects in a gray scale and the Hierarchy view will lose its hierarchical information and show objects as listed by name when a search is active.

When there is so much happening in a scene, it helps to have a 'search' option to filter out the object of your choice
